

Build an AI Agent in 60 Min > 5-Step Pattern

WHAT YOU BUILT: GitTrend

A Cortex AI agent that answers questions about trending GitHub repos in natural language.

THE STACK

- **GH Archive** 4B+ GitHub events — free, Marketplace
- **CoCo** Writes every SQL statement
- **CORTEX.COMPLETE** Turns results into language
- **Cortex Search** Semantic search on repo descriptions
- **Cortex Agent** Wires it all together
- **CoWork** Natural language interface

Same pattern works on any dataset.

Replace GH Archive w/ your sales data, support tickets, product telemetry, or internal docs.

THE 5 STEPS

1 Mount the data

Run setup SQL → COPY INTO loads 107M events from public S3 (~4 min).

2 CoCo explores the schema

Ask CoCo to describe GH_ARCHIVE.PUBLIC.EVENTS. It finds the right columns automatically.

3 Build the trending repos query

Tell CoCo what you want. It writes SQL filtering WatchEvent by AI/ML repos in the last 30 days.

4 Add CORTEX.COMPLETE

CoCo wraps your results in CORTEX.COMPLETE. Raw rows become a natural language summary.

5 Wire the agent

CREATE CORTEX SEARCH SERVICE + CREATE CORTEX AGENT. CoCo writes both. Execute
